WEBINAR:

Different Modalities to Study Mechanisms of Hemorrhagic Stroke in A Rat Model

1. **Do all animals with this spontaneous stroke model get a stroke? or is it only a certain percentage of the animals?**

   Yes, all the animals get spontaneous stroke with the 4% NaCl diet and the stroke occurs in a timely fashion. If they are on the regular salt diet, they do get a stroke, but it takes a few months down the line and the timing is unpredictable.

2. **Are you also going to test these treatments with the combined disease model of hypertension and arthritis, and do you expect to see the same effect?**

   Yes, the plan is to test the treatments (primarily the AT1R inhibition) on the multi-disease model. We are working on anti-inflammatory treatment options for vasculitis as well for the multi-disease model.
